IRIS / ENGINEERING ASSIGNMENT

Thuringia Citizen Portal Planning Harvester

TASK ID	IRIS-SIG-10
SOURCE / ENDPOINT	https://thueringen.de/bauleitplanung
INTEGRATION PATTERN	B (HTML)
DATA DESTINATION	iris_staging.signal_ingest

Objective

Filter industrial site approvals along the A4 corridor in Thuringia.

Implementation scope

- Identify the relevant publicly accessible source, confirm its current format, and implement the specified ingestion pattern.
- Extract the relevant records and preserve source identifiers, titles, publication dates, source URLs and geographic context when available.
- Normalize records for PostgreSQL 16 / PostGIS 3.4 and load them into iris_staging.signal_ingest using repeatable, idempotent operations.
- Resolve locations to EPSG:25832 point geometries where the source provides sufficient information; document ambiguous or unresolved locations.
- Handle pagination or incremental retrieval where applicable, plus network failures, duplicate records, malformed data and empty responses.

What to submit

- Python implementation and dependency/configuration instructions (no credentials in source code).
- README explaining data source, mapping assumptions, how to run, and known limitations.
- Automated tests with representative fixtures or mocks, including re-run/duplicate behavior.
- Sample anonymized or public-source output, validation queries, and concise error/quality report.

Acceptance criteria

- The required signal type and geographic/domain filtering match the objective above.
- The workflow produces valid, traceable staging records and does not duplicate them on re-run.
- Errors and missing fields are visible; invalid coordinates are not silently accepted.
- The implementation is maintainable, configurable and demonstrable without production access.

Candidate notes

Use only lawful, authorized access methods. If an endpoint, feed, or HTML selector in the brief is obsolete or inaccessible, document the issue and provide a tested fixture-based implementation and a justified alternative. Do not bypass access restrictions. Source access and publication dates must be verified rather than assumed.
